

# Chapter 3

## Chapter 3 - Free-fall and Projectile Motion

### Free-fall

- \* constant acceleration  $\rightarrow g = 9.8 \text{ m/s}^2$   
10  $\text{m/s}^2$  is close enough in most cases
- \* can be positive or negative depending on your perspective
- \* otherwise use the constant acceleration equations we have.

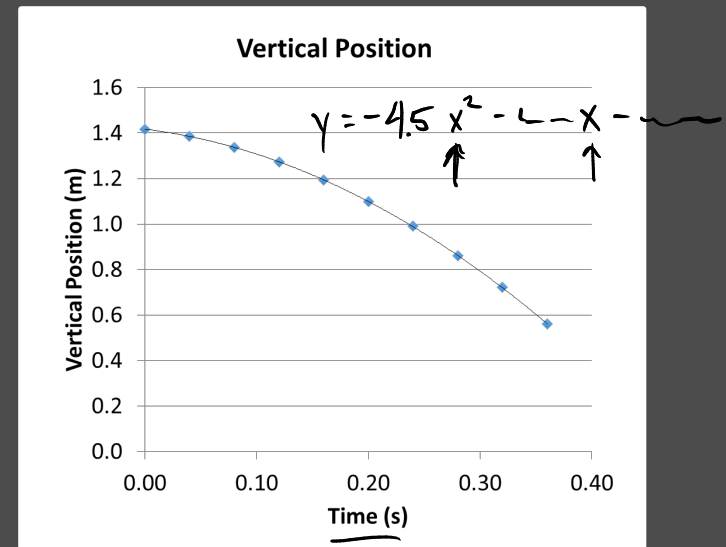

$$\rightarrow V_f = V_i + a \cdot t$$

↑  
 $g = (\pm 9.8 \text{ m/s}^2)$

$$\underline{y_f = y_i + v_i \cdot t + \frac{1}{2} a \cdot t^2}$$

↑  
 $g$

Vertical Motion of Free-Fall Object

$$\begin{aligned} \rightarrow y_f &= y_i + v_i \cdot t + \frac{1}{2} a \cdot t^2 \\ 0 &= +100 \text{ m} + 0 \cdot t + \frac{1}{2} (-9.8 \text{ m/s}^2) t^2 \\ 0 &= 100 \text{ m} + (-4.9 \text{ m/s}^2) t^2 \\ -100 &= -4.9 \text{ m/s}^2 \cdot t^2 \\ \frac{-100 \text{ m}}{-4.9 \text{ m/s}^2} &= \frac{-4.9 \text{ m/s}^2 \cdot t^2}{-4.9 \text{ m/s}^2} \\ \sqrt{20.4 \text{ s}^2} &= \sqrt{t^2} \\ \boxed{4.52 \text{ s} = t} \end{aligned}$$

$$\begin{aligned} v_f &= v_i + a \cdot t \\ \uparrow \quad \uparrow \quad \uparrow \\ ? \quad 0 \quad -9.8 \text{ m/s}^2 \\ v_f &= 0 - 9.8 \text{ m/s}^2 \cdot 4.52 \text{ s} \\ v_f &= -44.296 \text{ m/s} \\ \boxed{v_f = -44.3 \text{ m/s}} \end{aligned}$$

$$\begin{aligned} y_f &= y_i + v_i \cdot t + \frac{1}{2} a t^2 \\ \uparrow \quad \uparrow \quad \uparrow \quad \uparrow \\ 100 \text{ m} \quad 0 \text{ m} \quad 0 \text{ m/s} \quad 10 \text{ m/s} \\ 100 \text{ m} &= 0 + 0 \cdot t + \frac{1}{2} (10 \text{ m/s}^2) t^2 \\ 100 \text{ m} &= 5 \text{ m/s}^2 t^2 \\ \sqrt{20 \text{ s}^2} &= \sqrt{t^2} \\ 4.47 \text{ s} &= t \end{aligned}$$

$$\begin{aligned} v_f &= v_i + a \cdot t \\ v_f &= 10 \text{ m/s} \cdot (4.47 \text{ s}) \\ v_f &= +44.7 \text{ m/s} \end{aligned}$$

\* A person drops a ball off a 100 m cliff, and it falls with an acceleration of  $9.8 \text{ m/s}^2$ , find the final time and final velocity of the ball when it hits the ground.

How could I word the description of the problem above?

\* If I drop a ball from a 100 m high cliff, how long is it in the air? And how fast is it travelling when it hits the ground?

\* How long would it take for a ball to drop 100 m with no resistance starting from stand still (rest) and how fast is it traveling when it hits the ground?

What if I threw the object down to start with at 10 m/s initially?

quadratic equation  $\rightarrow$  more math  $\rightarrow$  more bad

Recall Quiz: If it takes 3.5 seconds for an object you drop to hit the ground, then how high are you above the ground?

$$y_f = y_i + v_i \cdot t + \frac{1}{2} a t^2$$

$\uparrow \quad \uparrow \quad \uparrow$   
 $0 \quad 0 \quad +9.8 \frac{\text{m}}{\text{s}^2}$

$$y_f = \frac{1}{2} (9.8 \frac{\text{m}}{\text{s}^2}) (3.5 \text{ s})^2$$

$$y_f = 60.0 \text{ m}$$

how fast is the object going?

$$v_f = v_i + a \cdot t$$

$$v_f = +9.8 \frac{\text{m}}{\text{s}^2} (3.5 \text{ s})$$

$$v_f = 35 \frac{\text{m}}{\text{s}}$$

acc. in free fall  
↓

$$a = g = 9.8 \frac{\text{m}}{\text{s}^2}$$

$$\approx 10 \frac{\text{m}}{\text{s}^2}$$

An object thrown straight up.

$$\rightarrow y_f = y_i + v_i t + \frac{1}{2} a t^2$$

how far?  
how long?

$$v_f = v_i + a t$$

$\uparrow$                        $\uparrow$                        $\uparrow$   
 $0 \text{ m/s}$             $+23 \text{ m/s}$             $-9.8 \text{ m/s}^2$

$$0 \text{ m/s} = +23 \text{ m/s} - 9.8 \text{ m/s}^2 \cdot t$$

$-23$                        $-23$

$$\frac{-23 \text{ m/s}}{-9.8 \text{ m/s}^2} = \frac{-9.8 \text{ m/s}^2 \cdot t}{-9.8 \text{ m/s}^2}$$

$$2.35 = t$$

$$y_f = 0 \text{ m} + 23 \text{ m/s} \cdot (2.35) + \frac{1}{2} (-9.8 \text{ m/s}^2) (2.35 \text{ s})^2$$

$$y_f = 54.05 \text{ m} - 26.95 \text{ m}$$

$$y_f = 26.9 \text{ m} = \underline{27 \text{ m}}$$

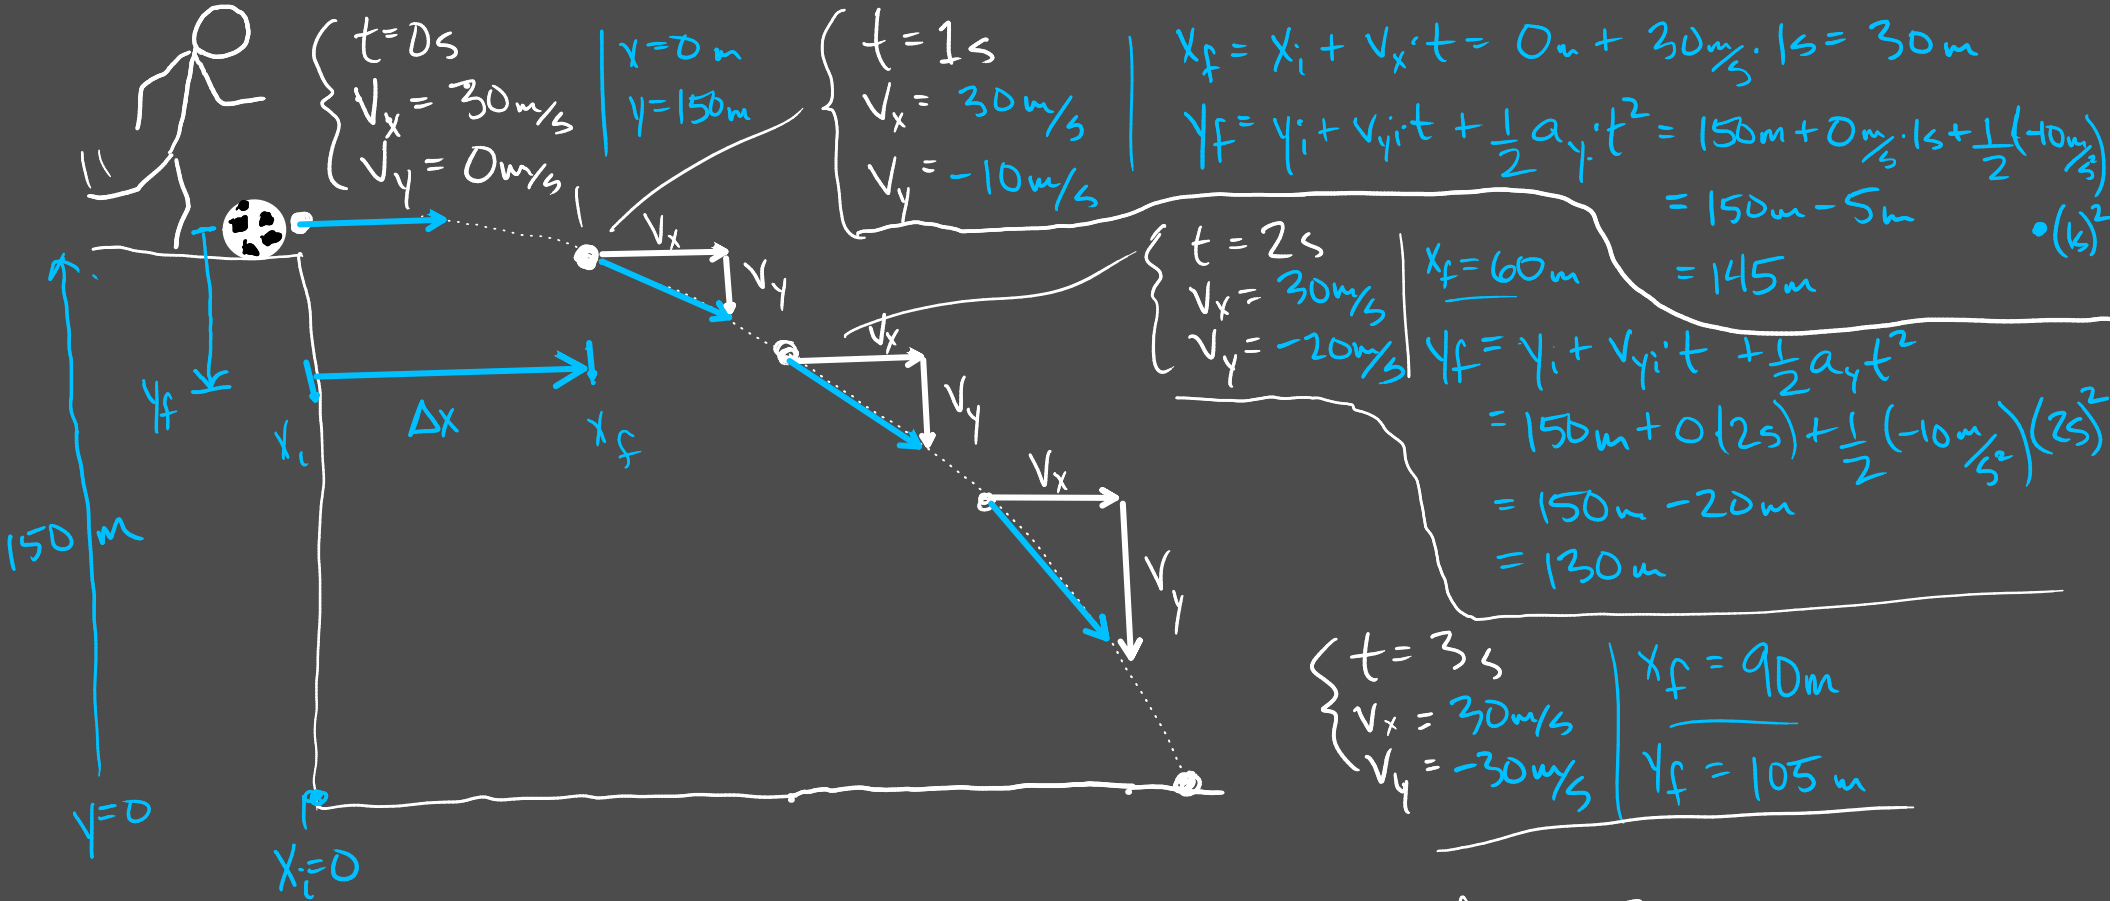

## Two dimensional projectile motion

Paths are in the shape of parabolas

Velocity is a vector quantity

- length of the arrow is proportional to size of the quantity
- direction of the arrow is the direction of the quantity.

So how long is the ball in the air?

$$y_f = y_i + \underbrace{v_{yi}}_0 t + \frac{1}{2} a_y t^2$$

$$0 \text{ m} = 150 \text{ m} + 0 \cdot t + \frac{1}{2} (-10 \text{ m/s}^2) \cdot t^2$$

$$0 \text{ m} = 150 \text{ m} - 5 \text{ m/s}^2 t^2$$

-150m   -150m

$$-150 \text{ m} = -5 \text{ m/s}^2 \cdot t^2$$

$$30 \text{ s}^2 = t^2 \Rightarrow \sqrt{30 \text{ s}^2} = t = \underline{\underline{5.5 \text{ s}}}$$

if  $v_x = 30 \text{ m/s}$ , how far from the base of cliff does the object land?

$$x_f = x_i + v_x \cdot t + \cancel{\frac{1}{2} a_x \cdot t^2}$$

$0 \rightarrow$

no acceleration in x-direction  
 $a_x = 0$

$$x_f = 30 \text{ m/s} \cdot 5.5 \text{ s} = \underline{\underline{165 \text{ m}}}$$

completely horizontal  
initial velocity

- fast horizontal speed
- short travel time based on initial height

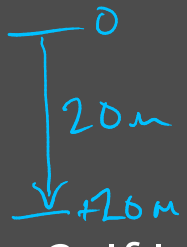

completely vertical  
initial velocity

- zero horizontal velocity  $\rightarrow$  no range  
no horizontal travel
- long travel time in the air

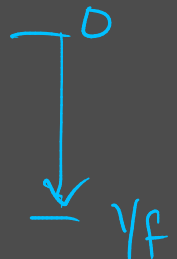

1. If I drop a ball from a height of 20m, how long will it take to land?

$$y_f = y_i + v_i \cdot t + \frac{1}{2} a t^2$$

↑      ↑      ↑      ↑  
+20m   0m   0m/s   +9.8m/s<sup>2</sup>

$$20m = \frac{1}{2} (+9.8m/s^2) t^2$$
$$4s^2 = t^2 \Rightarrow t = 2s$$

2. If I drop a ball and it takes 10 seconds to land, how high is the ledge?

know:  $t = 10s$       want: height =  $y_f$

$$v_i = 0$$
$$a = +9.8m/s^2$$
$$y_f = \frac{1}{2} (+9.8m/s^2) (10s)^2$$
$$y_f = 500m \rightarrow \text{height}$$

3. If I throw the ball downwards with an initial velocity of 10 m/s and it takes 10 seconds to hit the ground, then how fast is it going when it gets there? How high is the ledge?

4. If I throw a ball horizontally from a 50m cliff, how long will it take to land?  
What would be the travel time if I dropped it?
